# Structure connectivity and substructure connectivity of twisted hypercubes 

Dong Li, Xiaolan $\mathrm{Hu}^{\dagger}$, Huiqing Liu*

#### Abstract

Let $G$ be a graph and $T$ a certain connected subgraph of $G$. The $T$-structure connectivity $\kappa(G ; T)$ (or resp., $T$-substructure connectivity $\kappa^{s}(G ; T)$ ) of $G$ is the minimum number of a set of subgraphs $\mathcal{F}=\left\{T_{1}, T_{2}, \ldots, T_{m}\right\}$ (or resp., $\mathcal{F}=\left\{T_{1}^{\prime}, T_{2}^{\prime}, \ldots, T_{m}^{\prime}\right\}$ ) such that $T_{i}$ is isomorphic to $T$ (or resp., $T_{i}^{\prime}$ is a connected subgraph of $T$ ) for every $1 \leq i \leq m$, and $\mathcal{F}$ 's removal will disconnect $G$. The twisted hypercube $H_{n}$ is a new variant of hypercubes with asymptotically optimal diameter introduced by X.D. Zhu. In this paper, we will determine both $\kappa\left(H_{n} ; T\right)$ and $\kappa^{s}\left(H_{n} ; T\right)$ for $T \in\left\{K_{1, r}, P_{k}\right\}$, respectively, where $3 \leq r \leq 4$ and $1 \leq k \leq n$.

Keywords: Twisted hypercube; $T$-structure connectivity; $T$-substructure connectivity

## 1 Introduction

Interconnection networks play an important role in parallel and distributed systems. An interconnection network can be represented by an undirected graph $G=(V, E)$, where each vertex in $V$ corresponds to a processor, and every edge in $E$ corresponds to a communication link. The neighborhood $N_{G}(v)$ of a vertex $v$ in a graph $G=(V, E)$ is the set of vertices adjacent to $v$. For $S \subset V(G)$, the neighborhood $N_{G}(S)$ of $S$ in $G$ is defined as $N_{G}(S)=$ $\left(\cup_{v \in S} N_{G}(v)\right)-S$. We use $P_{k}=\left\langle v_{1}, v_{2}, \ldots, v_{k}\right\rangle$ and $C_{k}=\left\langle v_{1}, v_{2}, \ldots, v_{k}, v_{1}\right\rangle$ to denote a path and a cycle of order $k$, respectively. For $S \subset V(G)$, we use $G[S]$ to denote the subgraph of $G$ induced by $S$. For a subgraph $H$ of a graph $G$, we use $G-H$ to denote the subgraph of

[^0]$G$ induced by $V(G)-V(H)$. For a set $\mathcal{F}=\left\{T_{1}, T_{2}, \ldots, T_{m}\right\}$, where each $T_{i}$ is isomorphic to a connected subgraph of $G$, we use $G-\mathcal{F}$ to denote the subgraph of $G$ induced by $V(G)-V\left(T_{1}\right)-V\left(T_{2}\right)-\cdots-V\left(T_{m}\right)$. For graph definition and notation not mentioned here we follow [1].

The connectivity $\kappa(G)$ of a graph $G$ is the minimum number of vertices whose removal leaves the remaining graph disconnected or trivial. The connectivity is one of the most important parameters to measure the reliability and fault tolerance of an interconnection network [3], [4], [6], [7], [16]. The larger the connectivity is, more reliable the interconnection network is. However, this parameter has a deficiency. That is, it tacitly assumes that all vertices adjacent to the same vertex of $G$ could fail at the same time, which is highly unlikely for large-scale systems. To compensate for this shortcoming, Fábrega [5] proposed the concept of $g$-extra connectivity. The $g$-extra connectivity of a graph $G$, denoted by $\kappa_{g}(G)$, is the minimum number of vertices of $G$ whose deletion disconnects $G$ and every remaining component has more than $g$ vertices. Some recent results on the $g$-extra connectivity of graphs see [2], [8], [17], [18].

Instead of considering the effect of vertices becoming faulty, Lin et al. [9] considered the effect caused by some structures becoming faulty, and introduced the concept of structure connectivity and substructure connectivity of graphs. Let $T$ be a connected subgraph of a graph $G$, and $\mathcal{F}$ a set of subgraphs of $G$ such that every element in $\mathcal{F}$ is isomorphic to $T$. Then $\mathcal{F}$ is called a $T$-structure-cut if $G-\mathcal{F}$ is disconnected. The $T$-structure connectivity $\kappa(G ; T)$ of $G$ is defined as the cardinality of a minimum $T$-structure-cut of $G$. Similarly, let $\mathcal{F}$ be a set of subgraphs of $G$ such that every element in $\mathcal{F}$ is isomorphic to a connected subgraph of $T$. Then $\mathcal{F}$ is called a $T$-substructure-cut if $G-\mathcal{F}$ is disconnected. The $T$-substructure connectivity $\kappa^{s}(G ; T)$ of $G$ is defined as the cardinality of a minimum $T$-substructure-cut of $G$. By definition, $\kappa^{s}(G ; T) \leq \kappa(G ; T)$. Note that $K_{1}$-structure connectivity and $K_{1}$-substructure connectivity are exactly the classical vertex connectivity.

Lin et al. [9] determined $\kappa\left(Q_{n} ; T\right)$ and $\kappa^{s}\left(Q_{n} ; T\right)$ for the hypercube $Q_{n}$ and $T \in\left\{K_{1,1}, K_{1,2}\right.$, $\left.K_{1,3}, C_{4}\right\}$, respectively. Sabir and Meng [14] generalized their results and established $\kappa\left(Q_{n} ; T\right)$ and $\kappa^{s}\left(Q_{n} ; T\right)$ for $T \in\left\{P_{k}, C_{2 k}, K_{1,4}\right\}$, where $3 \leq k \leq n$, they also determined $\kappa\left(F Q_{n} ; T\right)$ and $\kappa^{s}\left(F Q_{n} ; T\right)$ for the folded hypercube $F Q_{n}$ and $T \in\left\{P_{k}, C_{2 k}, K_{1,3}\right\}$, where $n \geq 7$ and $2 \leq k \leq n$. Moreover, Mane [12] determined $\kappa\left(Q_{n} ; Q_{m}\right)$ with $m \leq n-2$ and established the upper bound of $\kappa\left(Q_{n} ; C_{2 k}\right)$ with $2 \leq k \leq 2^{n-1}$. Recently, Lv et al. 11] explored $\kappa\left(Q_{n}^{k} ; T\right)$ and $\kappa^{s}\left(Q_{n}^{k} ; T\right)$ for the $k$-ary $n$-cube $Q_{n}^{k}$ and $T \in\left\{K_{1}, K_{1,1}, K_{1,2}, K_{1,3}\right\}$.

The interconnection network considered in this study is the twisted hypercube $H_{n}$, which is a hypercube-like network with asymptotically optimal diameter introduced by Zhu [19].
$H_{n}$ has many attractive properties, such as low vertex degree, strong connectivity and super connectivity. Qi and Zhu [13] considered the fault-diameter and wide-diameter of the twisted hypercubes. Liu et al. 10 determined the $R^{g}$-vertex-connectivity and established the $g$-good neighbor conditional diagnosability of the twisted hypercubes under the PMC model and MM* model, respectively.

In this paper, we establish both $\kappa\left(H_{n} ; T\right)$ and $\kappa^{s}\left(H_{n} ; T\right)$ for $T \in\left\{K_{1, r}, P_{k}\right\}$, where $3 \leq$ $r \leq 4$ and $1 \leq k \leq n$. The rest of the paper is organized as follows. In Section 2, we introduce the definition of the $n$-dimensional twisted hypercube $H_{n}$ and provide preliminaries for our results. In Section 3, we determine $\kappa\left(H_{n} ; K_{1, r}\right)$ and $\kappa^{s}\left(H_{n} ; K_{1, r}\right)$ for $3 \leq r \leq 4$. In Section 4, we determine $\kappa\left(H_{n} ; P_{k}\right)$ and $\kappa^{s}\left(H_{n} ; P_{k}\right)$ for $1 \leq k \leq n$. Our conclusions are given in Section 5.

## 2 Preliminaries

In this section, we first introduce the definition of the $n$-dimensional twisted hypercube $H_{n}$, then present some properties of $H_{n}$.

Denote by $Z_{2}^{n}$ the set of binary strings of length $n$. For $x, y \in Z_{2}^{n}, x \oplus y$ denotes the sum of $x$ and $y$ in the group $Z_{2}^{n}$, i.e., $(x \oplus y)_{i}=x_{i}+y_{i}(\bmod 2)$ (for $x \in Z_{2}^{n}, x_{i}$ denotes the $i$ th bit of $x$ ).

If $x$ is a binary string of length $n_{1}$ and $y$ is a binary string of length $n_{2}$, then $x y$ is the concatenation of $x$ and $y$, which is a binary string of length $n_{1}+n_{2}$. If $Z$ is a set of binary strings, then let $x Z=\{x y: y \in Z\}$.

For $x \in Z_{2}^{n}$, and for $1 \leq i<j \leq n$, denote by $x[i, j]$ the binary $\operatorname{string} x_{i} x_{i+1} \ldots x_{j}$.
We first present an integer function $\kappa(n)$.
Definition 2.1 Let $\kappa$ be the integer function defined as the following:

$$
\kappa(n)= \begin{cases}0, & \text { if } n=1 \\ \max \left\{1,\left\lceil\log _{2} n-2 \log _{2} \log _{2} n\right\rceil\right\}, & \text { otherwise }\end{cases}
$$

Next, a permutation $\phi$ of binary strings is given as follows.
Definition 2.2 Assume $x \in Z_{2}^{n}$. Then $\phi(x) \in Z_{2}^{n}$ is the binary string such that

$$
\begin{aligned}
\phi(x)[1, \kappa(n)] & =x[1, \kappa(n)] \oplus x[n-\kappa(n)+1, n], \\
\phi(x)[\kappa(n)+1, n] & =x[\kappa(n)+1, n] .
\end{aligned}
$$

Note that the restriction of $\phi$ to $Z_{2}^{n}$ is indeed a permutation of $Z_{2}^{n}$, with $\phi^{2}(x)=x$.
Now we give a recursive definition of the twisted hypercubes.

Definition 2.3 Set $H_{1}:=K_{2}$, with vertices 0 and 1. For $n \geq 2, H_{n}$ is obtained from two copies of $H_{n-1}, 0 H_{n-1}$ and $1 H_{n-1}$, by adding edges connecting $0 x$ and $1 \phi(x)$ for all $x \in H_{n-1}$.

The vertex set of $H_{n}$ is $Z_{2}^{n}$. It follows from the definition that $H_{1}=K_{2}, H_{2}=C_{4}, H_{3}$ and $H_{4}$ are depicted in Figure 1.

$\mathrm{H}_{3}$

$H_{4}$

Figure 1. $H_{3}$ and $H_{4}$
By the definition of $H_{n}$, the following lemma is straightforward.
Lemma $2.4 H_{n}$ is triangle-free.
It is seen that $H_{n}$ is a kind of $n$-dimensional hypercube-like networks. Then $H_{n}$ is a $n$-regular graph with connectivity $n$. Furthermore, $H_{n}$ has the following properties.

Lemma 2.5 For any $u, v \in V\left(H_{n}\right), u$ and $v$ have at most two common neighbors.
Lemma 2.6 [15] $\kappa_{1}\left(H_{n}\right)=2 n-2$, where $n \geq 3$.
Lemma 2.7 [2] $\kappa_{2}\left(H_{n}\right)=3 n-5$, where $n \geq 5$.
Let $a \in\{0,1\}$ be an integer and $\bar{a}$ the complement of $a$, i.e., $\bar{a}=1-a$.
Let $u=u_{1} u_{2} \cdots u_{n} \in V\left(H_{n}\right)$. By the definition of the twisted hypercubes, $u$ has only one neighbor $\overline{u_{1}} \phi\left(u_{2} u_{3} \cdots u_{n}\right)$ in $\overline{u_{1}} H_{n-1}$, and $n-1$ neighbors in $u_{1} H_{n-1}$. For every neighbor $w=w_{1} w_{2} \cdots w_{n}$ of $u$ in $u_{1} H_{n-1}$, there exists some $q(1 \leq q \leq n-1)$ such that $w_{i}=u_{i}$ for $1 \leq i \leq q$. We use $u^{i}$ to denote the neighbor of $u$ with the same first $i-1$ bits as that of $u$, and $u^{i}$ is called the $(i)$-neighbor of $u$, where $1 \leq i \leq n$. That is, $u^{i}=u_{1} \cdots u_{i-1} \overline{u_{i}} \phi\left(u_{i+1} \cdots u_{n}\right)=$ $u_{1} \cdots u_{i-1} \overline{u_{i}}\left(u_{i+1} \oplus u_{n-\kappa+1}\right)\left(u_{i+2} \oplus u_{n-\kappa+2}\right) \cdots\left(u_{i+\kappa} \oplus u_{n}\right) u_{i+\kappa+1} \cdots u_{n}$, where $\kappa=\kappa(n-i)$.

Note that there are $n-i$ neighbors of $u^{i}$ in $u_{1} \cdots u_{i-1} \overline{u_{i}} H_{n-i}$, we use $u^{i, j}$ to denote the neighbor of $u^{i}$ with the same first $i+j-1$ bits as that of $u^{i}$, and $u^{i, j}$ is called the $(i, j)$-neighbor of $u$, where $1 \leq j \leq n-i$. Denote $\kappa_{i}=\kappa(n-i)$. Then

$$
u^{i, j}=\left\{\begin{array}{r}
u^{i}[1, i]\left(u_{i+1} \oplus u_{n-\kappa_{i}+1}\right) \cdots\left(u_{i+j-1} \oplus u_{n-\kappa_{i}+j-1}\right)\left(\overline{u_{i+j} \oplus u_{n-\kappa_{i}+j}}\right) \phi\left(u^{i}[i+j+1, n]\right), \\
\text { if } 1 \leq j \leq \kappa_{i}, \\
u^{i}[1, i]\left(u_{i+1} \oplus u_{n-\kappa_{i}+1}\right) \cdots\left(u_{i+\kappa_{i}} \oplus u_{n}\right) u_{i+\kappa_{i}+1} \cdots u_{i+j-1} \overline{u_{i+j} \phi\left(u_{i+j+1} \cdots u_{n}\right)} \\
\text { if } \kappa_{i}+1 \leq j \leq n-i
\end{array}\right.
$$

Specially,

$$
u^{i, 1}=\left\{\begin{array}{cl}
u_{1} \cdots u_{i-1} \bar{u}_{i}\left(\overline{u_{i+1} \oplus u_{n}}\right)\left(u_{i+2} \oplus u_{n}\right) u_{i+3} \cdots u_{n}, & \text { if } \kappa_{i}=\kappa_{i+1}=1 \\
u_{1} \cdots u_{i-1} \bar{u}_{i}\left(\overline{u_{i+1} \oplus u_{n-\kappa+1}}\right)\left(u_{i+2} \oplus u_{n-\kappa+2} \oplus u_{n-\kappa+1}\right) & \\
\cdots\left(u_{i+\kappa} \oplus u_{n} \oplus u_{n-1}\right)\left(u_{i+\kappa+1} \oplus u_{n}\right) u_{i+\kappa+2} \cdots u_{n}, & \text { if } \kappa_{i}=\kappa_{i+1}=\kappa \geq 2 \\
u_{1} \cdots u_{i-1} \bar{u}_{i}\left(\overline{u_{i+1} \oplus u_{n-\kappa+1}}\right) u_{i+2} \cdots u_{n}, & \text { if } \kappa_{i}=\kappa_{i+1}+1=\kappa
\end{array}\right.
$$

Similarly, there are $n-i-j$ neighbors of $u^{i, j}$ in $u_{1} \cdots u_{i-1} \overline{u_{i}}\left(u_{i+1} \oplus u_{n-\kappa_{i}+1}\right) \cdots\left(u_{i+j-1} \oplus\right.$ $\left.u_{n-\kappa_{i}+j-1}\right)\left(\overline{u_{i+j} \oplus u_{n-\kappa_{i}+j}}\right) H_{n-i-j}$ if $1 \leq j \leq \kappa_{i}$, in $u_{1} \cdots u_{i-1} \overline{u_{i}}\left(u_{i+1} \oplus u_{n-\kappa_{i}+1}\right) \cdots\left(u_{i+\kappa_{i}} \oplus\right.$ $\left.u_{n}\right) u_{i+\kappa_{i}+1} \cdots u_{i+j-1} \overline{u_{i+j}} H_{n-i-j}$ if $\kappa_{i}+1 \leq j \leq n-i$. We use $u^{i, j, k}$ to denote the neighbor of $u^{i, j}$ with the same first $i+j+k-1$ bits as that of $u^{i, j}$, and $u^{i, j, k}$ is called the $(i, j, k)$-neighbor of $u$, where $1 \leq k \leq n-i-j$. Specially,

$$
u^{i, 1,1}= \begin{cases}u_{1} \cdots u_{i-1} \overline{u_{i}}\left(\overline{u_{i+1} \oplus u_{n}}\right)\left(\overline{u_{i+2} \oplus u_{n}}\right) \phi\left(u_{i+3} \cdots u_{n}\right), & \text { if } \kappa_{i}=\kappa_{i+1}=1, \\ u_{1} \cdots u_{i-1} \overline{u_{i}}\left(\overline{u_{i+1} \oplus u_{n-1}}\right)\left(\overline{u_{i+2} \oplus u_{n} \oplus u_{n-1}}\right) \phi\left(\left(u_{i+3} \oplus u_{n}\right) u_{i+4} \cdots u_{n}\right), \\ & \text { if } \kappa_{i}=\kappa_{i+1}=2, \\ u_{1} \cdots u_{i-1} \overline{u_{i}}\left(\overline{u_{i+1} \oplus u_{n-\kappa+1}}\right)\left(\overline{u_{i+2} \oplus u_{n-\kappa+2} \oplus u_{n-\kappa+1}}\right) \phi\left(u^{i, 1}[i+3, n]\right), \\ & \text { if } \kappa=\kappa_{i}=\kappa_{i+1} \geq 3 \\ u_{1} \cdots u_{i-1} \overline{u_{i}}\left(\overline{u_{i+1} \oplus u_{n-\kappa+1}}\right) \overline{u_{i+2}} \phi\left(u_{i+3} \cdots u_{n}\right), & \text { if } \kappa_{i}=\kappa_{i+1}+1=\kappa\end{cases}
$$

At the same time,

$$
u^{i, 1,2}=\left\{\begin{aligned}
& u_{1} \cdots u_{i-1} \overline{u_{i}}\left(\overline{u_{i+1} \oplus u_{n}}\right)\left(u_{i+2} \oplus u_{n}\right) \overline{u_{i+3}} \phi\left(u_{i+4} \cdots u_{n}\right), \text { if } \kappa_{i}=\kappa_{i+1}=1, \\
& u_{1} \cdots u_{i-1} \overline{u_{i}}\left(\overline{u_{i+1} \oplus u_{n-1}}\right)\left(u_{i+2} \oplus u_{n} \oplus u_{n-1}\right)\left(\overline{u_{i+3} \oplus u_{n}}\right) \phi\left(u_{i+4} \cdots u_{n}\right), \\
& \text { if } \kappa_{i}=\kappa_{i+1}=2, \\
& u_{1} \cdots u_{i-1} \overline{u_{i}}\left(\overline{u_{i+1} \oplus u_{n-2}}\right)\left(u_{i+2} \oplus u_{n-1} \oplus u_{n-2}\right)\left(\overline{u_{i+3} \oplus u_{n} \oplus u_{n-1}}\right) \phi\left(u^{i, 1}[i+4, n]\right), \\
& \text { if } \kappa_{i}=\kappa_{i+1}=3, \\
& u_{1} \cdots u_{i-1} \overline{u_{i}}\left(\overline{u_{i+1} \oplus u_{n-\kappa+1}}\right)\left(u_{i+2} \oplus u_{n-\kappa+2} \oplus u_{n-\kappa+1}\right)\left(\overline{u_{i+3} \oplus u_{n-\kappa+3} \oplus u_{n-\kappa+2}}\right) \\
& \phi\left(\left(u_{i+4} \oplus u_{n-\kappa+4} \oplus u_{n-\kappa+3}\right) \cdots\left(u_{i+\kappa} \oplus u_{n} \oplus u_{n-1}\right)\left(u_{i+\kappa+1} \oplus u_{n}\right) u_{i+\kappa+2} \cdots u_{n}\right), \\
& \text { if } \kappa=\kappa_{i}=\kappa_{i+1} \geq 4, \\
& u_{1} \cdots u_{i-1} \overline{u_{i}}\left(\overline{u_{i+1} \oplus u_{n-\kappa+1}}\right) u_{i+2} \overline{u_{i+3}} \phi\left(u_{i+4} \cdots u_{n}\right), \text { if } \kappa_{i}=\kappa_{i+1}+1=\kappa .
\end{aligned}\right.
$$

Let $u^{h(\cdot)}$ be a vertex of $H_{n}$. If the first $i$ bits of $u^{h(\cdot)}$ is $u_{1} u_{2} \cdots u_{i}$, then $u^{h(\cdot)}$ has exactly one neighbor in $u_{1} u_{2} \cdots u_{i-1} \overline{u_{i}} H_{n-i}$, and we denote this neighbor $u^{h(\cdot), i^{*}}$. For example, let $u=0010 \in H_{4}$, then $u^{1}=1010, u^{2}=0110, u^{3}=0000, u^{4}=0011, u^{1,1}=u^{2,1^{*}}=1110, u^{2,1}=$ $0100, u^{3,1}=0001, u^{3,1^{*}}=1000, u^{4,1^{*}}=1111, u^{2,1,1^{*}}=1100, u^{3,1,1^{*}}=1101$. Figure 2 illustrates the neighbors of $u$.

Figure 2. Some neighbors related to a vertex $u$ of $H_{n}$
Note that $u^{i+1}=u_{1} u_{2} \cdots u_{i} \overline{u_{i+1}} \phi\left(u_{i+2} u_{i+3} \cdots u_{n}\right)$. Then

$$
u^{i+1, i^{*}}=\left\{\begin{array}{cl}
u_{1} \cdots u_{i-1} \bar{u}_{i}\left(\overline{u_{i+1} \oplus u_{n}}\right)\left(u_{i+2} \oplus u_{n}\right) u_{i+3} \cdots u_{n}, & \text { if } \kappa_{i}=\kappa_{i+1}=1 \\
u_{1} \cdots u_{i-1} \bar{u}_{i}\left(\overline{u_{i+1} \oplus u_{n-\kappa+1}}\right)\left(u_{i+2} \oplus u_{n-\kappa+1} \oplus u_{n-\kappa+2}\right) & \\
\cdots\left(u_{i+\kappa} \oplus u_{n-1} \oplus u_{n}\right)\left(u_{i+\kappa+1} \oplus u_{n}\right) u_{i+\kappa+2} \cdots u_{n}, & \text { if } \kappa_{i}=\kappa_{i+1}=\kappa \geq 2 \\
u_{1} \cdots u_{i-1} \bar{u}_{i}\left(\overline{u_{i+1} \oplus u_{n-\kappa+1}}\right) u_{i+2} \cdots u_{n}, & \text { if } \kappa_{i}=\kappa_{i+1}+1=\kappa
\end{array}\right.
$$

It is seen that $u^{i+1, i^{*}}=u^{i, 1}$. Then $u^{i, 1}$ is a common neighbor of $u^{i}$ and $u^{i+1}$. Note that $u$ is also a common neighbor of $u^{i}$ and $u^{i+1}$. By Lemma 2.5, any two vertices have at most two common neighbors. So we have the following proposition.

Proposition 2.8 Let $u=u_{1} u_{2} \cdots u_{n}$ be any vertex of $H_{n}$ and $N_{H_{n}}(u)=\left\{u^{1}, u^{2}, \ldots, u^{n}\right\}$. Then $N_{H_{n}}\left(u^{i}\right) \cap N_{H_{n}}\left(u^{i+1}\right)=\left\{u, u^{i, 1}\right\}$, where $1 \leq i \leq n-1$.

Recall that for $u=u_{1} \cdots u_{n} \in V\left(H_{n}\right), u^{n}=u_{1} \cdots u_{n-1} \overline{u_{n}}, u^{n-1}=u_{1} \cdots u_{n-2} \overline{u_{n-1}} u_{n}$ and $u^{n-1,1}=u_{1} u_{2} \cdots u_{n-2} \overline{u_{n-1}} \overline{u_{n}}$, we have

$$
\begin{aligned}
u^{n, i^{*}} & =u_{1} \cdots u_{i-1} \overline{u_{i}} \phi\left(u_{i+1} \cdots u_{n-1} \overline{u_{n}}\right), \\
u^{n-1,1,1^{*}} & =\overline{u_{1}} \phi\left(u_{2} \cdots u_{n-2} \overline{u_{n-1}} \overline{u_{n}}\right), \\
u^{n-1,1,2^{*}} & =u_{1} \overline{u_{2}} \phi\left(u_{3} \cdots u_{n-2} \overline{u_{n-1}} \overline{u_{n}}\right) .
\end{aligned}
$$

The following two propositions are straightforward.
Proposition 2.9 For any $u=u_{1} u_{2} \ldots u_{n} \in V\left(H_{n}\right), N_{H_{n}}(u)=\left\{u^{1}, u^{2}, \ldots, u^{n}\right\}$, Then
(a) $u^{i, 1} \neq u^{j, 1}$ for $1 \leq i \neq j \leq n-1$.
(b) $u^{n-1,1,1^{*}} \neq u^{1,1}, u^{n-1,1,1^{*}} \neq u^{1,1,1}$ and $u^{n-1,1,1^{*}} \neq u^{1,1,2}$.
(c) $u^{n-1,1,2^{*}} \neq u^{2,1}, u^{n-1,1,2^{*}} \neq u^{2,1,1}$ and $u^{n-1,1,2^{*}} \neq u^{2,1,2}$.
(d) $u^{n, i^{*}} \neq u^{i, 1}, u^{n, i^{*}} \neq u^{i, 1,1}$ and $u^{n, i^{*}} \neq u^{i, 1,2}$, where $1 \leq i \leq n-3$.

Proposition 2.10 For any $u=u_{1} u_{2} \ldots u_{n} \in V\left(H_{n}\right), N_{H_{n}}(u)=\left\{u^{1}, u^{2}, \ldots, u^{n}\right\}$, then

$$
\begin{aligned}
u^{n,(n-2)^{*}} & \neq u^{n-2,1}, \\
u^{n,(n-2)^{*},(n-3)^{*}} & \neq u^{n-3,1}, \\
& \vdots \\
u^{n,(n-2)^{*},(n-3)^{*}, \ldots, 2^{*}} & \neq u^{2,1}, \\
u^{n,(n-2)^{*},(n-3)^{*}, \ldots, 2^{*}, 1^{*}} & \neq u^{1,1} .
\end{aligned}
$$

By Lemma 2.4 and Proposition 2.8, we have following proposition.

Proposition 2.11 For any $u=u_{1} u_{2} \ldots u_{n} \in V\left(H_{n}\right), N_{H_{n}}(u)=\left\{u^{1}, u^{2}, \ldots, u^{n}\right\}$, we have
(a) $H_{n}\left[\left\{u^{i}, u^{i, 1}, u^{i+1}, u^{i, 1,1}\right\}\right]$ is a $K_{1,3}$ with center $u^{i, 1}$, where $1 \leq i \leq n-2$.
(b) $H_{n}\left[\left\{u^{n}, u^{n-1,1}, u^{n, 1^{*}}, u^{n, 2^{*}}\right\}\right]$ is a $K_{1,3}$ with center $u^{n}$.
(c) $H_{n}\left[\left\{u^{n-1}, u^{n-1,1}, u^{n}, u^{n-1,1,1^{*}}\right\}\right]$ is a $K_{1,3}$ with center $u^{n-1,1}$.
(d) $H_{n}\left[\left\{u^{i}, u^{i, 1}, u^{i+1}, u^{i, 1,1}, u^{i, 1,2}\right\}\right]$ is a $K_{1,4}$ with center $u^{i, 1}$, where $1 \leq i \leq n-3$.
(e) $H_{n}\left[\left\{u^{n}, u^{n-1,1}, u^{n, 1^{*}}, u^{n, 2^{*}}, u^{n, 3^{*}}\right\}\right]$ is a $K_{1,4}$ with center $u^{n}$.
(f) $H_{n}\left[\left\{u^{n-1}, u^{n-1,1}, u^{n}, u^{n-1,1,1^{*}}, u^{n-1,1,2^{*}}\right\}\right]$ is a $K_{1,4}$ with center $u^{n-1,1}$.
(g) $H_{n}\left[\left\{u^{n-2}, u^{n-2,1}, u^{n-1}, u^{n-2,1,1}, u^{n-2,1,1^{*}}\right\}\right]$ is a $K_{1,4}$ with center $u^{n-2,1}$.

## $3 \kappa\left(H_{n} ; K_{1, r}\right)$ and $\kappa^{s}\left(H_{n} ; K_{1, r}\right)$ for $r \in\{3,4\}$

In this section, we first show some properties of $H_{n}$ related to stars, then explore the $T$ structure connectivity and $T$-substructure connectivity of $H_{n}$ for $T=K_{1,3}$ and $T=K_{1,4}$, respectively.

Lemma 3.1 Let $K_{1, r}$ be a star in $H_{n}$. If $u$ is a vertex of $H_{n}-K_{1, r}$, then $\left|N_{H_{n}}(u) \cap V\left(K_{1, r}\right)\right| \leq$ 2.

Proof. Let $x$ be the center of the star $K_{1, r}$. If $(x, u) \in E\left(H_{n}\right)$, then $N_{H_{n}}(u) \cap V\left(K_{1, r}\right)=\{x\}$ by Lemma2.4. That is, $\left|N_{H_{n}}(u) \cap V\left(K_{1, r}\right)\right|=1$. If $(x, u) \notin E\left(H_{n}\right)$, then $\left|N_{H_{n}}(u) \cap V\left(K_{1, r}\right)\right| \leq$ 2 as $u$ and $x$ have at most two common neighbors by Lemma 2.5.

Lemma 3.2 Let $K_{1,3}$ be a star in $H_{n}$. If $u$ and $v$ are two adjacent vertices of $H_{n}-K_{1,3}$, then $\left|N_{H_{n}}(\{u, v\}) \cap V\left(K_{1,3}\right)\right| \leq 3$.

Proof. Let $V\left(K_{1,3}\right)=\left\{x, x_{1}, x_{2}, x_{3}\right\}$ and $E\left(K_{1,3}\right)=\left\{\left(x, x_{1}\right),\left(x, x_{2}\right),\left(x, x_{3}\right)\right\}$. If $(x, u) \in$ $E\left(H_{n}\right)$, then $N_{H_{n}}(u) \cap V\left(K_{1,3}\right)=\{x\}$ by Lemma 2.4. That is, $\left|N_{H_{n}}(u) \cap V\left(K_{1,3}\right)\right|=1$. By Lemma 3.1, $\left|N_{H_{n}}(v) \cap V\left(K_{1,3}\right)\right| \leq 2$. Then $\left|N_{H_{n}}(\{u, v\}) \cap V\left(K_{1,3}\right)\right| \leq 3$. Therefore $(x, u) \notin E\left(H_{n}\right)$. By the symmetry of $u$ and $v,(x, v) \notin E\left(H_{n}\right)$. Then $N_{H_{n}}(\{u, v\}) \cap V\left(K_{1,3}\right) \subseteq$ $\left\{x_{1}, x_{2}, x_{3}\right\}$ and thus $\left|N_{H_{n}}(\{u, v\}) \cap V\left(K_{1,3}\right)\right| \leq 3$.

Lemma 3.3 Let $K_{1, r}$ be a star in $H_{n}$ with center $x$. If $u$ and $v$ are two adjacent vertices of $H_{n}-K_{1, r}$, then $\left|N_{H_{n}}(\{u, v\}) \cap V\left(K_{1, r}\right)\right| \leq 4$. Moreover, if $\left|N_{H_{n}}(\{u, v\}) \cap V\left(K_{1, r}\right)\right|=4$, then $(u, x),(v, x) \notin E\left(H_{n}\right)$ and $u, v, x \in V\left(a H_{n-1}\right)$ for some $a \in\{0,1\}$.

Proof. By Lemma 3.1, $\left|N_{H_{n}}(u) \cap V\left(K_{1, r}\right)\right| \leq 2$ and $\left|N_{H_{n}}(v) \cap V\left(K_{1, r}\right)\right| \leq 2$. Then $\left|N_{H_{n}}(\{u, v\}) \cap V\left(K_{1, r}\right)\right| \leq 4$.

Suppose that $\left|N_{H_{n}}(\{u, v\}) \cap V\left(K_{1, r}\right)\right|=4$, in the following, we show that $u, v, x \in$ $V\left(a H_{n-1}\right)$ for some $a \in\{0,1\}$. Note that $\left|N_{H_{n}}(u) \cap V\left(K_{1, r}\right)\right|=2$ and $\left|N_{H_{n}}(v) \cap V\left(K_{1, r}\right)\right|=2$, then $(u, x),(v, x) \notin E\left(H_{n}\right)$. If $u \in V\left(0 H_{n-1}\right)$ and $v \in V\left(1 H_{n-1}\right)$, then $x$ and $v$ have at most one common neighbor if $x \in V\left(0 H_{n-1}\right)$, and $x$ and $u$ have at most one common neighbor if $x \in V\left(1 H_{n-1}\right)$, a contradiction. Therefore $u, v \in V\left(a H_{n-1}\right)$ for some $a \in\{0,1\}$. If $x \in V\left(\bar{a} H_{n-1}\right)$, then $N_{H_{n}}(\{u, v\}) \cap N_{H_{n}}(x) \subseteq\left\{u^{1}, v^{1}, x^{1}\right\}$, i.e, $\left|N_{H_{n}}(\{u, v\}) \cap V\left(K_{1, r}\right)\right| \leq 3$, a contradiction. Therefore $x \in V\left(a H_{n-1}\right)$.

Lemma 3.4 Let $F_{1}, F_{2}, \ldots, F_{\lceil n / 2\rceil-1}$ be $\left\lceil\frac{n}{2}\right\rceil-1$ stars in $H_{n}$. If $u$ and $v$ are two adjacent vertices of $H_{n}-\cup_{i=1}^{\lceil n / 2\rceil-1} V\left(F_{i}\right)$, then $\left|N_{H_{n}}(\{u, v\}) \cap\left(\cup_{i=1}^{[n / 2\rceil-1} V\left(F_{i}\right)\right)\right| \leq 2 n-3$.

Proof. Note that $\left|N_{H_{n}}(\{u, v\})\right|=2 n-2$, suppose to the contrary that $\mid N_{H_{n}}(\{u, v\}) \cap$ $\left(\cup_{i=1}^{[n / 2]-1} V\left(F_{i}\right)\right) \mid=2 n-2$. By Lemma 3.3. $\left|N_{H_{n}}(\{u, v\}) \cap V\left(K_{1, r}\right)\right| \leq 4$, then $2 n-2=$ $\left|N_{H_{n}}(\{u, v\}) \cap\left(\cup_{i=1}^{[n / 2\rceil-1} V\left(F_{i}\right)\right)\right| \leq 4\left(\left\lceil\frac{n}{2}\right\rceil-1\right)$. Thus $n$ is odd, $\left|N_{H_{n}}(\{u, v\}) \cap V\left(F_{i}\right)\right|=4$ for $1 \leq i \leq\lceil n / 2\rceil-1$ and $N_{H_{n}}(\{u, v\}) \cap\left(\cup_{i=1}^{\lceil n / 2\rceil} V\left(F_{i}\right)\right)=N_{H_{n}}(\{u, v\})$. Let $x_{i}$ be the center of $F_{i}$, then $\left(u, x_{i}\right),\left(v, x_{i}\right) \notin E\left(H_{n}\right)$ and $u, v, x_{i} \in V\left(a H_{n-1}\right)$ for some $a \in\{0,1\}$ by Lemma 3.3. Assume, without loss of generality, that $u^{1} \in F_{1}$. Then $u^{1} \neq x_{1}$ as $\left(u, x_{1}\right) \notin E\left(H_{n}\right)$. On the other hand, $\left(u^{1}, x_{1}\right) \in E\left(H_{n}\right)$, which implies $x_{1} \in V\left(\bar{a} H_{n-1}\right)$, a contradiction.

Lemma $3.5 \kappa^{s}\left(H_{n} ; K_{1, r}\right) \geq\left\lceil\frac{n}{2}\right\rceil$ for $3 \leq r \leq 4$ and $n \geq 4$.
Proof. Let $\mathcal{F}=\{\underbrace{P_{1}, \ldots, P_{1}}_{x_{1}}, \underbrace{P_{2}, \ldots, P_{2}}_{x_{2}}, \underbrace{P_{3}, \ldots, P_{3}}_{x_{3}}, \underbrace{K_{1,3}, \ldots, K_{1,3}}_{x_{4}}\}$ if $r=3$, and $\mathcal{F}=$ $\{\underbrace{P_{1}, \ldots, P_{1}}_{x_{1}}, \underbrace{P_{2}, \ldots, P_{2}}_{x_{2}}, \underbrace{P_{3}, \ldots, P_{3}}_{x_{3}}, \underbrace{K_{1,3}, \ldots, K_{1,3}}_{x_{4}}, \underbrace{M_{1,4}, \ldots, K_{1,4}^{x_{4}}}_{x_{5}}\}$ if $r=4$, where $x_{i} \geq 0$ and $1 \leq i \leq r+1$. Then $|\mathcal{F}|=\sum_{i=1}^{r+1} x_{i}$. Suppose to the contrary that $|\mathcal{F}| \leq\left\lceil\frac{n}{2}\right\rceil-1$ and $H_{n}-\mathcal{F}$ is disconnected, then $H_{n}-\mathcal{F}$ has at least two components. Let $C$ be the smallest component of $H_{n}-\mathcal{F}$. We consider the following three cases.

Case 1. $|V(C)|=1$.
In this case, $C$ is an isolated vertex $w$. Note that $\left|N_{H_{n}}(w)\right|=n$. By Lemmas 2.4 and 3.1, every element in $\mathcal{F}$ contains at most two neighbors of $w$, then $2|\mathcal{F}| \geq\left|N_{H_{n}}(w)\right|$. Thus, $2\left(\left\lceil\frac{n}{2}\right\rceil-1\right) \geq n$, a contradiction.

Case 2. $|V(C)|=2$.
In this case, $C$ is an edge $(u, v)$. Note that $N_{H_{n}}(\{u, v\})=2 n-2$. If $r=3$, every element in $\mathcal{F}$ contains at most three neighbors of $\{u, v\}$ by Lemmas 2.4 and 3.2, then $3|\mathcal{F}| \geq\left|N_{H_{n}}(\{u, v\})\right|$. Thus $3\left(\left\lceil\frac{n}{2}\right\rceil-1\right) \geq 2 n-2$, a contradiction. Therefore $r=4$. By Lemma 3.4, all elements in $\mathcal{F}$ contains at most $2 n-3$ neighbors of $\{u, v\}$, a contradiction.

Case 3. $|V(C)| \geq 3$.
Note that $|\mathcal{F}| \leq\left\lceil\frac{n}{2}\right\rceil-1$ and every element in $\mathcal{F}$ contains at most five vertices, then $|V(\mathcal{F})| \leq 5\left(\left\lceil\frac{n}{2}\right\rceil-1\right)$. If $n=4$, then $|V(\mathcal{F})| \leq 5$. By Lemma 2.6, $\kappa_{1}\left(H_{n}\right)=2 n-2=6$, which implies that we have to delete at least 6 vertices to separate $C$ from $H_{4}$, a contradiction. Therefore $n \geq 5$. By Lemma 2.7, $\kappa_{2}\left(H_{n}\right)=3 n-5$, which implies that we have to delete at least $3 n-5>5\left(\left\lceil\frac{n}{2}\right\rceil-1\right)$ vertices to separate $C$ from $H_{n}$, a contradiction.

Thus, $\kappa^{s}\left(H_{n} ; K_{1,3}\right) \geq\left\lceil\frac{n}{2}\right\rceil$.

## $3.1 \kappa\left(H_{n} ; K_{1,3}\right)$ and $\kappa^{s}\left(H_{n} ; K_{1,3}\right)$

Lemma 3.6 $\kappa\left(H_{n} ; K_{1,3}\right) \leq\left\lceil\frac{n}{2}\right\rceil$ for $n \geq 4$.
Proof. For any $u=u_{1} \cdots u_{n} \in V\left(H_{n}\right), N_{H_{n}}(u)=\left\{u^{1}, \ldots, u^{n}\right\}$. Let $T_{i}$ be the subgraph induced by $\left\{u^{i}, u^{i, 1}, u^{i+1}, u^{i, 1,1}\right\}$ for $1 \leq i \leq n-2$. If $n$ is odd, we let $T_{n}$ be the subgraph induced by $\left\{u^{n}, u^{n-1,1}, u^{n, 1^{*}}, u^{n, 2^{*}}\right\}$; and if $n$ is even, let $T_{n-1}$ the subgraph induced by $\left\{u^{n-1}, u^{n-1,1}, u^{n}, u^{n-1,1,1^{*}}\right\}$. Then $T_{i}$ is a $K_{1,3}$ by Proposition 2.11 (a-c) for $1 \leq i \leq n$, and $V\left(T_{i}\right) \cap V\left(T_{j}\right)=\emptyset$ by Proposition 2.9 for $1 \leq i \neq j \leq n$.

Set $\mathcal{S}=\left\{T_{1}, T_{3}, \ldots, T_{n-2}, T_{n}\right\}$ if $n$ is odd; and $\mathcal{S}=\left\{T_{1}, T_{3}, \ldots, T_{n-3}, T_{n-1}\right\}$ if $n$ is even. Then, in either case, $H_{n}-\mathcal{S}$ is disconnected, one component is $\{u\}$ and $|\mathcal{S}|=\left\lceil\frac{n}{2}\right\rceil$. Thus, $\kappa\left(H_{n} ; K_{1,3}\right) \leq\left\lceil\frac{n}{2}\right\rceil$.

Note that $\kappa^{s}\left(H_{n} ; K_{1,3}\right) \leq \kappa\left(H_{n} ; K_{1,3}\right)$, and thus, by Lemmas 3.5 and 3.6, we have the following result.

Theorem 3.7 $\kappa\left(H_{n} ; K_{1,3}\right)=\kappa^{s}\left(H_{n} ; K_{1,3}\right)=\left\lceil\frac{n}{2}\right\rceil$ for $n \geq 4$.

## $3.2 \kappa\left(H_{n} ; K_{1,4}\right)$ and $\kappa^{s}\left(H_{n} ; K_{1,4}\right)$

Lemma $3.8 \kappa\left(H_{n} ; K_{1,4}\right) \leq\left\lceil\frac{n}{2}\right\rceil$ for $n \geq 4$.
Proof. For any $u \in V\left(H_{n}\right), N_{H_{n}}(u)=\left\{u^{1}, \ldots, u^{n}\right\}$. Let $T_{i}$ be the subgraph induced by $\left\{u^{i}, u^{i, 1}, u^{i+1}, u^{i, 1,1}, u^{i, 1,2}\right\}$ for $1 \leq i \leq n-3$. If $n$ is odd, we let $T_{n-2}$ be the subgraph induced by $\left\{u^{n-2}, u^{n-2,1}, u^{n-1}, u^{n-2,1,1}, u^{n-2,1,1^{*}}\right\}$ and $T_{n}$ the subgraph induced by $\left\{u^{n}, u^{n-1,1}, u^{n, 1^{*}}, u^{n, 2^{*}}, u^{n, 3^{*}}\right\}$; and if $n$ is even, let $T_{n-1}$ be the subgraph induced by $\left\{u^{n-1}\right.$, $\left.u^{n-1,1}, u^{n}, u^{n-1,1,1^{*}}, u^{n-1,1,2^{*}}\right\}$. Then $T_{i}$ is a $K_{1,4}$ by Proposition $2.11(\mathrm{~d}-\mathrm{g})$ for $1 \leq i \leq n$, and $V\left(T_{i}\right) \cap V\left(T_{j}\right)=\emptyset$ by Proposition 2.9 for $1 \leq i \neq j \leq n$.

Set $\mathcal{S}=\left\{T_{1}, T_{3}, \ldots, T_{n-4}, T_{n-2}, T_{n}\right\}$ if $n$ is odd; and $\mathcal{S}=\left\{T_{1}, T_{3}, \ldots, T_{n-3}, T_{n-1}\right\}$ if $n$ is even. Then, in either case, $H_{n}-\mathcal{S}$ is disconnected, one component is $\{u\}$ and $|\mathcal{S}|=\left\lceil\frac{n}{2}\right\rceil$. Thus, $\kappa\left(H_{n} ; K_{1,4}\right) \leq\left\lceil\frac{n}{2}\right\rceil$ and $\kappa^{s}\left(H_{n} ; K_{1,4}\right) \leq\left\lceil\frac{n}{2}\right\rceil$.

Note that $\kappa^{s}\left(H_{n} ; K_{1,4}\right) \leq \kappa\left(H_{n} ; K_{1,4}\right)$, and hence, by Lemmas 3.5 and 3.8, we have the following result.

Theorem 3.9 $\kappa\left(H_{n} ; K_{1,4}\right)=\kappa^{s}\left(H_{n} ; K_{1,4}\right)=\left\lceil\frac{n}{2}\right\rceil$ for $n \geq 4$.

## $4 \kappa\left(H_{n} ; P_{k}\right)$ and $\kappa^{s}\left(H_{n} ; P_{k}\right)$

Recall that $\kappa\left(H_{n} ; P_{1}\right)=\kappa^{s}\left(H_{n} ; P_{1}\right)=\kappa\left(H_{n}\right)=n$ for $n \geq 3$. So we assume $k \geq 2$.

## $4.1 \kappa\left(H_{n} ; P_{2}\right)$ and $\kappa^{s}\left(H_{n} ; P_{2}\right)$

Lemma 4.1 If $\kappa(n-1) \geq 2$, then $H_{n}$ does not consists of $n-1$ quadrilaterals sharing a common edge.

Proof. For any $u=u_{1} u_{2} \ldots u_{n} \in V\left(H_{n}\right)$, we show that for any $1 \leq i \leq n-2, u^{i}$ and $u^{n}$ have no other common neighbors other than $u$, and $u^{n-1}$ and $u^{1}$ have no other common neighbors other than $u$.

Recall that $u^{i}=u_{1} \cdots u_{i-1} \overline{u_{i}}\left(u_{i+1} \oplus u_{n-\kappa_{i}+1}\right) \cdots\left(u_{i+\kappa_{i}} \oplus u_{n}\right) u_{i+\kappa_{i}+1} \cdots u_{n-1} u_{n}$, where $\kappa_{i}=\kappa(n-i)$.

First we assume $i \leq n-2$. We only need to show that $\left(u^{i}\right)^{j} \neq\left(u^{n}\right)^{k}$ for $1 \leq j \neq i \leq n$ and $1 \leq k \leq n-1$. If $1 \leq j \neq i \leq n-1$, then $\left(u^{i}\right)^{j}[n]=u_{n} \neq \overline{u_{n}}=\left(u^{n}\right)^{k}[n]$, thus $\left(u^{i}\right)^{j} \neq\left(u^{n}\right)^{k}$. Therefore $j=n$. If $i \neq k$, then $\left(u^{i}\right)^{n}[i] \neq\left(u^{n}\right)^{k}[i]$; and if $i=k$, then $\left(u^{i}\right)^{n}\left[i+\kappa_{i}\right]=u_{i+\kappa_{i}} \oplus u_{n} \neq u_{i+\kappa_{i}} \oplus \overline{u_{n}}=\left(u^{n}\right)^{i}\left[i+\kappa_{i}\right]$. Thus $\left(u^{i}\right)^{n} \neq\left(u^{n}\right)^{k}$.

Now we assume $i=n-1$. We only need to show that $\left(u^{1}\right)^{p} \neq\left(u^{n-1}\right)^{q}$ for $2 \leq p \leq n$ and $1 \leq q \neq n-1 \leq n$. If $2 \leq p \leq n-2$, then $\left(u^{1}\right)^{p}[n-1, n]=u_{n-1} u_{n} \neq \overline{u_{n-1}} u_{n}=\left(u^{n-1}\right)^{q}[n-1, n]$ for $1 \leq q \leq n-2$ and $\left(u^{1}\right)^{p}[n-1, n]=u_{n-1} u_{n} \neq \overline{u_{n-1}} \overline{u_{n}}=\left(u^{n-1}\right)^{n}[n-1, n]$, and thus $\left(u^{1}\right)^{p} \neq\left(u^{n-1}\right)^{q}$. If $p=n$, then $\left(u^{1}\right)^{n}[n-1, n]=u_{n-1} \overline{u_{n}} \neq \overline{u_{n-1}} u_{n}=\left(u^{n-1}\right)^{q}[n-1, n]$ for $1 \leq q \leq n-2$ and $\left(u^{1}\right)^{n}[n-1, n]=u_{n-1} \overline{u_{n}} \neq \overline{u_{n-1}} \overline{u_{n}}=\left(u^{n-1}\right)^{n}[n-1, n]$, and thus $\left(u^{1}\right)^{n} \neq\left(u^{n-1}\right)^{q}$. Therefore $p=n-1$. If $q \neq 1$, then $\left(u^{1}\right)^{n-1}[1] \neq\left(u^{n-1}\right)^{q}[1]$; and if $q=1$, then $\left(u^{n-1}\right)^{1}=\overline{u_{1}}\left(u_{2} \oplus u_{n-\kappa_{1}+1}\right) \cdots\left(u_{\kappa_{1}-1} \oplus u_{n-2}\right)\left(u_{\kappa_{1}} \oplus \overline{u_{n-1}}\right)\left(u_{\kappa_{1}+1} \oplus u_{n}\right) u_{\kappa_{1}+2} \cdots u_{n-2} \overline{u_{n-1}} u_{n}$ as $\kappa_{1}=\kappa(n-1) \geq 2$ and thus $\left(u^{1}\right)^{n-1}\left[\kappa_{1}\right]=\left(u_{\kappa_{1}} \oplus u_{n-1}\right) \neq\left(u_{\kappa_{1}} \oplus \overline{u_{n-1}}\right)=\left(u^{n-1}\right)^{1}\left[\kappa_{1}\right]$. Hence $\left(u^{1}\right)^{n-1} \neq\left(u^{n-1}\right)^{q}$.

Lemma $4.2 \kappa\left(H_{n} ; P_{2}\right) \leq n-1$ if $\kappa(n-1)=1$ and $\kappa\left(H_{n} ; P_{2}\right) \leq n$ if $\kappa(n-1) \geq 2$.
Proof. we distinguish cases pertaining to the value of $\kappa(n)$ in the following.
Case 1. $\kappa(n-1)=1$.
In this case, we set $u=00 \cdots 0$. Then $u^{i}=0 \cdots 0 u_{i} 0 \cdots 0$, where $u_{i}=1,1 \leq i \leq n$. Let $v=u^{n-1}=0 \cdots 010$, then $v^{i}=0 \cdots 0 v_{i} 0 \cdots 010$, where $v_{i}=1,1 \leq i \leq n-2 ; v^{n}=0 \cdots 011$. Note that if $\kappa(n-1)=1$, then $\left(u^{i}, v^{i}\right) \in E\left(H_{n}\right)$; and hence $C_{4}=\left\langle u, u^{i}, v^{i}, v, u\right\rangle$ is a cycle of length 4.

Set $\mathcal{S}=\left\{u^{i} v^{i}: 1 \leq i \leq n\right.$ and $\left.i \neq n-1\right\}$. Then, $H_{n}-\mathcal{S}$ is disconnected, one component is $\{u, v\}$ and $|\mathcal{S}|=n-1$. Thus, $\kappa\left(H_{n} ; P_{2}\right) \leq n-1$.

Case 2. $\kappa(n-1) \geq 2$.

In this case, for any $u=u_{1} u_{2} \ldots u_{n} \in V\left(H_{n}\right), N_{H_{n}}(u)=\left\{u^{1}, u^{2}, \ldots, u^{n}\right\}$. By Lemma 4.1, $H_{n}$ does not consists of $n-1$ quadrilaterals sharing a common edge. So we can set that $T_{i}$ be the subgraph induced by $\left\{u^{i}, u^{i, 1}\right\}$ for $1 \leq i \leq n-1$, then $T_{i}$ is isomorphic to $P_{2}$.

Set $\mathcal{S}=\left\{T_{1}, T_{2}, \ldots, T_{n-1}, T_{n}\right\}$, where $T_{n}$ is the subgraph induced by $\left\{u^{n}, u^{n, 1^{*}}\right\}$. Then, $H_{n}-\mathcal{S}$ is disconnected, one component is $\{u\}$ and $|\mathcal{S}|=n$. Thus, $\kappa\left(H_{n} ; P_{2}\right) \leq n$.

Lemma $4.3 \kappa^{s}\left(H_{n} ; P_{2}\right) \geq n-1$ if $\kappa(n-1)=1$ and $\kappa^{s}\left(H_{n} ; P_{2}\right) \geq n$ if $\kappa(n-1) \geq 2$.

Proof. we distinguish cases pertaining to the value of $\kappa(n)$ in the following.
Case 1. $\kappa(n-1)=1$.
Let $\mathcal{F}=\{\underbrace{P_{1}, \ldots, P_{1}}_{x_{1}}, \underbrace{P_{2}, \ldots, P_{2}}_{x_{2}}\}$ and $|\mathcal{F}|=x_{1}+x_{2} \leq n-2$ for $x_{1}, x_{2} \geq 0$. Suppose to the contrary that $H_{n}-\mathcal{F}$ is disconnected, then $H_{n}-\mathcal{F}$ has at least two components. Let $C$ be the smallest component of $H_{n}-\mathcal{F}$. We consider following two cases.

Subcase 1.1. $|V(C)|=1$.
In this subcase, we set $V(C)=\{w\}$. Note that $\left|N_{H_{n}}(w)\right|=n$. By Lemma 2.4, every element in $\mathcal{F}$ contains at most one neighbor of $w$. Thus, we have to delete at least $n$ elements of $\mathcal{F}$ to isolate $C$. But it is impossible since $|\mathcal{F}| \leq n-2<n$.

Subcase 1.2. $|V(C)| \geq 2$.
In this subcase, by Lemma 2.6, $\kappa_{1}\left(H_{n}\right)=2 n-2$. This implies that we have to delete at least $2 n-2$ vertices to isolate $C$. Since $|\mathcal{F}| \leq n-2$, we have $|V(\mathcal{F})| \leq 2(n-2)=2 n-4<$ $2 n-2$, a contradiction. Thus, $\kappa^{s}\left(H_{n} ; P_{2}\right) \geq n-1$ and $\kappa\left(H_{n} ; P_{2}\right) \geq n-1$.

Case 2. $\kappa(n-1) \geq 2$.
In this case, $n>5$. Let $\mathcal{F}=\{\underbrace{P_{1}, \ldots, P_{1}}_{x_{1}}, \underbrace{P_{2}, \ldots, P_{2}}_{x_{2}}\}$ and $|\mathcal{F}|=x_{1}+x_{2} \leq n-1$ for $x_{1}, x_{2} \geq 0$. Suppose to the contrary that $H_{n}-\mathcal{F}$ is disconnected, then $H_{n}-\mathcal{F}$ has at least two components. Let $C$ be the smallest component of $H_{n}-\mathcal{F}$. We consider following three cases.

Subcase 2.1. $|V(C)|=1$.
In this subcase, we set $V(C)=\{w\}$. Note that $\left|N_{H_{n}}(w)\right|=n$. By Lemma 2.4, every element in $\mathcal{F}$ contains at most one neighbor of $w$. Thus, we have to delete at least $n$ elements of $\mathcal{F}$ to isolate $C$. But it is impossible since $|\mathcal{F}| \leq n-1<n$.

Subcase 2.2. $|V(C)|=2$.

In this subcase, $C$ is an edge of $H_{n}$ and $\left|N_{H_{n}}(C)\right|=2 n-2$. By Lemma 2.6 and Lemma 4.1, we have to delete at least $\frac{2 n-2}{2}+1=n$ elements of $\mathcal{F}$ to separate $C$. However, $|\mathcal{F}| \leq n-1<n$, a contradiction.

## Subcase 2.3. $|V(C)| \geq 3$.

In this subcase, by Lemma 2.7, $\kappa_{2}\left(H_{n}\right)=3 n-5$. This implies that we have to delete at least $3 n-5$ vertices to isolate $C$. Since $|\mathcal{F}| \leq n-1$, we have $|V(\mathcal{F})| \leq 2(n-1)=2 n-2<$ $3 n-5$, a contradiction with $n>5$. Thus, $\kappa^{s}\left(H_{n} ; P_{2}\right) \geq n$ and $\kappa\left(H_{n} ; P_{2}\right) \geq n$.

Note that $\kappa^{s}\left(H_{n} ; P_{2}\right) \leq \kappa\left(H_{n} ; P_{2}\right)$, and hence, by Lemmas 4.2 and 4.3, we have the following result.

Theorem $4.4 \kappa\left(H_{n} ; P_{2}\right)=\kappa^{s}\left(H_{n} ; P_{2}\right)=n-1$ if $\kappa(n-1)=1 ; \kappa\left(H_{n} ; P_{2}\right)=\kappa^{s}\left(H_{n} ; P_{2}\right)=n$ if $\kappa(n-1) \geq 2$.

## $4.2 \kappa\left(H_{n} ; P_{k}\right)$ and $\kappa^{s}\left(H_{n} ; P_{k}\right)$ with $k \geq 3$

Lemma 4.5 Let $P_{k}$ be a path of order $k$ in $H_{n}$ with $1 \leq k \leq n$. If $v$ is a vertex of $H_{n}-P_{k}$, then $\left|N_{H_{n}}(v) \cap V\left(P_{k}\right)\right| \leq\left\lceil\frac{k}{2}\right\rceil$.

Proof. By Lemma 2.4, $v$ can be adjacent to at most one vertex of any two consecutive vertices on $P_{k}$. Thus, the lemma follows.

Lemma 4.6 Let $P_{k}$ be a path of order $k$ in $H_{n}$ with $3 \leq k \leq n$. If $u$ and $v$ are two adjacent vertices of $H_{n}-P_{k}$, then $\left|N_{H_{n}}(\{u, v\}) \cap V\left(P_{k}\right)\right| \leq 2\left\lfloor\frac{k}{3}\right\rfloor+(k(\bmod 3))$. Moreover, $\left|N_{H_{n}}(\{u, v\}) \cap V\left(P_{k}\right)\right| \leq k-1$.

Proof. Let $P_{k}=\left\langle v_{1}, v_{2}, \ldots, v_{k}\right\rangle$. We first show that

$$
\begin{equation*}
\left|N_{H_{n}}(\{u, v\}) \cap\left\{v_{i-1}, v_{i}, v_{i+1}\right\}\right| \leq 2 \text { for } 2 \leq i \leq k-1 \tag{*}
\end{equation*}
$$

Otherwise, we suppose that $\left|N_{H_{n}}(\{u, v\}) \cap\left\{v_{i-1}, v_{i}, v_{i+1}\right\}\right| \geq 3$ for some $i(2 \leq i \leq k-1)$. Without loss of generality, we assume that $\left|N_{H_{n}}(u) \cap\left\{v_{i-1}, v_{i}, v_{i+1}\right\}\right| \geq 2$. By Lemma 2.4, we have $u v_{i-1}, u v_{i+1} \in E\left(H_{n}\right)$, and $u v_{i} \notin E\left(H_{n}\right)$. Moreover, $\left|N_{H_{n}}(u) \cap\left\{v_{i-1}, v_{i}, v_{i+1}\right\}\right|=2$. Then $\left|N_{H_{n}}(v) \cap\left\{v_{i-1}, v_{i}, v_{i+1}\right\}\right| \geq 1$ and $v v_{i-1}, v v_{i+1} \notin E\left(H_{n}\right)$ by Lemma 2.4. So $v v_{i} \in E\left(H_{n}\right)$, and thus $\left\{v, v_{i-1}, v_{i+1}\right\} \subseteq N(u) \cap N\left(v_{i}\right)$, a contradiction with Lemma 2.5.

Now we prove this lemma by induction on $k$. For $k=3$, by the above proof, $\mid N_{H_{n}}(\{u, v\}) \cap$ $V\left(P_{3}\right) \mid \leq 2$. In the induction step, assume that the lemma is true for $3 \leq k \leq l$. When $k=l+1,\left|N_{H_{n}}\left(v_{l+1}\right) \cap\{u, v\}\right| \leq 1$ by Lemma 2.4, and then $\left|N_{H_{n}}(\{u, v\}) \cap V\left(P_{l+1}\right)\right| \leq$ $\left|N_{H_{n}}(\{u, v\}) \cap V\left(P_{l}\right)\right|+1 \leq 2\left\lfloor\frac{l}{3}\right\rfloor+(l(\bmod 3))+1$ by the inductive hypothesis.

Note that if $(l+1)(\bmod 3)=1$ or 2 , then $(l+1)(\bmod 3)=l(\bmod 3)+1$ and $\left\lfloor\frac{l}{3}\right\rfloor=\left\lfloor\frac{l+1}{3}\right\rfloor$, and hence $2\left\lfloor\frac{l}{3}\right\rfloor+(l(\bmod 3))+1=2\left\lfloor\frac{l+1}{3}\right\rfloor+((l+1)(\bmod 3))$. So, in the following, we assume that $l \geq 5$ and $(l+1)(\bmod 3)=0$. Then $(l-2)(\bmod 3)=0$. By $(*),\left|N_{H_{n}}(\{u, v\}) \cap V\left(P_{l+1}\right)\right| \leq$ $\left|N_{H_{n}}(\{u, v\}) \cap V\left(P_{l-2}\right)\right|+2 \leq 2\left\lfloor\frac{l-2}{3}\right\rfloor+2=2\left\lfloor\frac{l+1}{3}\right\rfloor$.

Therefore the proof of the lemma is complete.

Lemma 4.7 Let $3 \leq k \leq n$. Then $\kappa\left(H_{n} ; P_{k}\right) \leq\left\lceil\frac{2 n}{k+1}\right\rceil$ if $k$ is odd and $\kappa\left(H_{n} ; P_{k}\right) \leq\left\lceil\frac{2 n}{k}\right\rceil$ if $k$ is even.

Proof. For any $u=u_{1} u_{2} \ldots u_{n} \in V\left(H_{n}\right), N_{H_{n}}(u)=\left\{u^{1}, u^{2}, \ldots, u^{n}\right\}$, we distinguish cases pertaining to the parity of $k$ in the following.

Case 1. $k$ is odd.
In this case, we denote $t:=\frac{k+1}{2}$. Let $n=q t+r$ for some nonnegative integers $q$ and $r$ with $0 \leq r \leq \frac{k-1}{2}$. Since $n \geq k$, we have $q \geq 1$.

Subcase 1.1. $r=0$.
In this subcase, we set

$$
\begin{aligned}
P^{1} & =\left\langle u^{1}, u^{1,1}, u^{2}, \ldots, u^{t-1}, u^{t-1,1}, u^{t}\right\rangle \\
P^{2} & =\left\langle u^{t+1}, u^{t+1,1}, u^{t+2}, \ldots, u^{k}, u^{k, 1}, u^{k+1}\right\rangle, \\
\vdots & \\
P^{q} & =\left\langle u^{n-t+1}, u^{n-t+1,1}, u^{n-t+2}, \ldots, u^{n-1}, u^{n-1,1}, u^{n}\right\rangle .
\end{aligned}
$$

Then $V\left(P^{i}\right) \cap V\left(P^{j}\right)=\emptyset$ by Proposition 2.10 for $1 \leq i \neq j \leq q$, and then $\mathcal{F}=\left\{P^{1}, P^{2}, \ldots, P^{q}\right\}$ forms a $P_{k}$-structure-cut of $H_{n}$, one component of $H_{n}-\mathcal{F}$ is $\{u\}$ and $|\mathcal{F}|=\frac{2 n}{k+1}$.

Subcase 1.2. $1 \leq r \leq \frac{k-1}{2}$.
In this subcase, we set

$$
\begin{aligned}
& P^{1}=\left\langle u^{1}, u^{1,1}, u^{2}, \ldots, u^{t-1}, u^{t-1,1}, u^{t}\right\rangle \\
& P^{2}=\left\langle u^{t+1}, u^{t+1,1}, u^{t+2}, \ldots, u^{k}, u^{k, 1}, u^{k+1}\right\rangle \\
& \quad \\
& P^{q}=\left\langle u^{n-r-t+1}, u^{n-r-t+1,1}, u^{n-r-t+2}, \ldots, u^{n-r-1}, u^{n-r-1,1}, u^{n-r}\right\rangle, \\
& P^{(q+1)}=\left\langle u^{n-r+1}, u^{n-r+1,1}, u^{n-r+2}, \ldots, u^{n}, u^{n,(n-2)^{*}}, \ldots, u^{n,(n-2)^{*}, \ldots,(n-k+2 r-2)^{*}}\right\rangle .
\end{aligned}
$$

Then $V\left(P^{i}\right) \cap V\left(P^{j}\right)=\emptyset$ by Proposition 2.10 for $1 \leq i \neq j \leq q+1$, and then $\mathcal{F}=$ $\left\{P^{1}, P^{2}, \ldots, P^{q}, P^{(q+1)}\right\}$ forms a $P_{k}$-structure-cut of $H_{n}$, one component of $H_{n}-\mathcal{F}$ is $\{u\}$ and $|\mathcal{F}|=\left\lceil\frac{2 n}{k+1}\right\rceil$.

Thus, in either subcase, $\kappa\left(H_{n} ; P_{k}\right) \leq\left\lceil\frac{2 n}{k+1}\right\rceil$.
Case 2. $k$ is even.

In this case, we denote $a:=\frac{k}{2}$. Let $n=q a+r$ for some nonnegative integers $q$ and $r$ with $0 \leq r \leq \frac{k-2}{2}$. Since $n \geq k$, we have $q \geq 1$.

Subcase 2.1. $r=0$.
In this subcase, we set

$$
\begin{aligned}
P^{1} & =\left\langle u^{1}, u^{1,1}, u^{2}, \ldots, u^{a}, u^{a, 1}\right\rangle \\
P^{2} & =\left\langle u^{a+1}, u^{a+1,1}, u^{a+2}, \ldots, u^{k}, u^{k, 1}\right\rangle \\
& \vdots \\
P^{q} & =\left\langle u^{n-a+1}, u^{n-a+1,1}, u^{n-a+2}, \ldots, u^{n}, u^{n, 1^{*}}\right\rangle .
\end{aligned}
$$

Then $V\left(P^{i}\right) \cap V\left(P^{j}\right)=\emptyset$ by Proposition 2.10 for $1 \leq i \neq j \leq q$, and then $\mathcal{F}=\left\{P^{1}, P^{2}, \ldots, P^{q}\right\}$ forms a $P_{k}$-structure-cut of $H_{n}$, one component of $H_{n}-\mathcal{F}$ is $\{u\}$ and $|\mathcal{F}|=\frac{2 n}{k}$.

Subcase 2.2. $1 \leq r \leq \frac{k-2}{2}$.
In this subcase, we set

$$
\begin{aligned}
& P^{1}=\left\langle u^{1}, u^{1,1}, u^{2}, \ldots, u^{a}, u^{a, 1}\right\rangle \\
& P^{2}=\left\langle u^{a+1}, u^{a+1,1}, u^{a+2}, \ldots, u^{k}, u^{k, 1}\right\rangle \\
& \vdots \\
& P^{q}=\left\langle u^{n-r-a+1}, u^{n-r-a+1,1}, u^{n-r-a+2}, \ldots, u^{n-r}, u^{n-r, 1}\right\rangle \\
& P^{(q+1)}=\left\langle u^{n-r+1}, u^{n-r+1,1}, u^{n-r+2}, \ldots, u^{n}, u^{n,(n-2)^{*}}, \ldots, u^{n,(n-2)^{*}, \ldots,(n-k+2 r-2)^{*}}\right\rangle .
\end{aligned}
$$

Then $V\left(P^{i}\right) \cap V\left(P^{j}\right)=\emptyset$ by Proposition 2.10 for $1 \leq i \neq j \leq q+1$, and then $\mathcal{F}=$ $\left\{P^{1}, P^{2}, \ldots, P^{q}, P^{(q+1)}\right\}$ forms a $P_{k}$-structure-cut of $H_{n}$, one component of $H_{n}-\mathcal{F}$ is $\{u\}$ and $|\mathcal{F}|=\left\lceil\frac{2 n}{k}\right\rceil$.

Thus, $\kappa\left(H_{n} ; P_{k}\right) \leq\left\lceil\frac{2 n}{k}\right\rceil$.
The proof of the lemma is now complete.

Lemma 4.8 Let $3 \leq k \leq n$. Then $\kappa^{s}\left(H_{n} ; P_{k}\right) \geq\left\lceil\frac{2 n}{k+1}\right\rceil$ if $k$ is odd and $\kappa^{s}\left(H_{n} ; P_{k}\right) \geq\left\lceil\frac{2 n}{k}\right\rceil$ if $k$ is even.

Proof. If no confusion should arise, we use $\mathcal{F}=\{\underbrace{P_{1}, \ldots, P_{1}}_{x_{1}}, \underbrace{P_{2}, \ldots, P_{2}}_{x_{2}}, \ldots, \underbrace{P_{k}, \ldots, P_{k}}_{x_{k}}\}$ to denote a set of connected subgraphs of $P_{k}$ with $|\mathcal{F}|=\sum_{i=1}^{k} x_{i}$ for $x_{i} \geq 0$.

If $3 \leq n \leq 4$, then $k=3$ or $k=4$ as $3 \leq k \leq n$. So in either case, it suffices to show that $H_{n}-\mathcal{F}$ is connected whenever $|\mathcal{F}| \leq 1$. If $x_{k}=0$, then $H_{n}-P_{i}$ is connected for $1 \leq i \leq k-1$ since $\kappa\left(H_{n}\right)=n \geq k$. Hence, we may assume that $x_{k}=1$, and consequently $x_{1}=\cdots=x_{k-1}=0$. That is, $\mathcal{F}=\left\{P_{k}\right\}$. Assume that $H_{n}-P_{k}$ is disconnected, then each component of $H_{n}-P_{k}$ contains at least two vertices as $H_{n}$ is $n$-regular and triangle-free. On the other hand, by Lemma 2.6, $\kappa_{1}\left(H_{n}\right)=2 n-2>k=\left|V\left(P_{k}\right)\right|$, a contradiction.

So, in the following, we may assume that $n \geq 5$. We proceed this by contradiction.
Case 1. $k$ is odd.
Suppose to the contrary that $|\mathcal{F}| \leq\left\lceil\frac{2 n}{k+1}\right\rceil-1$ and $H_{n}-\mathcal{F}$ is disconnected, then $H_{n}-\mathcal{F}$ has at least two components. Without loss of generality, let $C$ be the smallest component of $H_{n}-\mathcal{F}$. We consider the following two cases.

Case 1.1. $|V(C)|=1$.
In this subcase, $C$ is an isolated vertex. Let $V(C)=\{w\}$, then $\left|N_{H_{n}}(w)\right|=n$. By Lemma 4.5. every element in $\mathcal{F}$ contains at most $\frac{k+1}{2}$ neighbors of $w$. Thus, $\frac{k+1}{2}|\mathcal{F}| \geq n$, i.e. $\frac{k+1}{2}\left(\left\lceil\frac{2 n}{k+1}\right\rceil-1\right) \geq n$, a contradiction.

## Case 1.2. $|V(C)| \geq 2$.

In this subcase, $C$ contains at least one edge. By Lemma 2.6, $\kappa_{1}\left(H_{n}\right)=2 n-2$. This implies that we have to delete at least $2 n-2$ vertices to separate $C$ from $H_{n}$. However, from the assumption $|\mathcal{F}| \leq\left\lceil\frac{2 n}{k+1}\right\rceil-1$, we infer that $|V(\mathcal{F})| \leq k\left(\left\lceil\frac{2 n}{k+1}\right\rceil-1\right) \leq k\left(\frac{2 n+k-1}{k+1}-1\right)=$ $\frac{k}{k+1}(2 n-2)<2 n-2$, a contradiction.

Case 2. $k$ is even.
Suppose to the contrary that $|\mathcal{F}| \leq\left\lceil\frac{2 n}{k}\right\rceil-1$ with $H_{n}-\mathcal{F}$ being disconnected, and let $C$ be the smallest component of $H_{n}-\mathcal{F}$. Consider the following three cases.

Case 2.1. $|V(C)|=1$.
In this subcase, $C$ is an isolated vertex. Let $V(C)=\{w\}$, then $\left|N_{H_{n}}(w)\right|=n$. By Lemma 4.5, every element in $\mathcal{F}$ contains at most $\frac{k}{2}$ neighbors of $w$. Thus, $\frac{k}{2}|\mathcal{F}| \geq n$, i.e. $\frac{k}{2}\left(\left\lceil\frac{2 n}{k}\right\rceil-1\right) \geq n$, a contradiction.

Case 2.2. $|V(C)|=2$.
In this subcase, $C$ is an edge of $H_{n}$. Suppose that $V(C)=\{u, v\}$, then $\left|N_{H_{n}}(\{u, v\})\right|=$ $2 n-2$. By Lemma 2.6, every element in $\mathcal{F}$ contains at most $k-1$ neighbors of $\{u, v\}$. It means that we have to delete at least $\left\lceil\frac{2 n-2}{k-1}\right\rceil$ vertices of $\mathcal{F}$ to separate $C$. However, $|\mathcal{F}| \leq\left\lceil\frac{2 n}{k}\right\rceil-1 \leq \frac{2 n+k-2}{k}-1=\frac{2 n-2}{k}<\left\lceil\frac{2 n-2}{k-1}\right\rceil$, a contradiction.

Case 2.3. $|V(C)| \geq 3$.
In this subcase, $|V(\mathcal{F})| \leq k\left(\left\lceil\frac{2 n}{k}\right\rceil-1\right)$ from the assumption $|\mathcal{F}| \leq\left\lceil\frac{2 n}{k}\right\rceil-1$. On the other hand, $\kappa_{2}\left(H_{n}\right)=3 n-5$ by Lemma 2.7, which implied that we have to delete at least $3 n-5$ vertices to separate $C$ from $H_{n}$. However, it is easily to check that $|V(\mathcal{F})| \leq k\left(\left\lceil\frac{2 n}{k}\right\rceil-1\right)<$ $3 n-5$ for $n \geq 5$, a contradiction.

Therefore we complete the proof of Lemma 4.8 .
Recall that $\kappa^{s}\left(H_{n} ; P_{k}\right) \leq \kappa\left(H_{n} ; P_{k}\right)$, and hence, by Lemmas 4.7 and 4.8, we have the
following result.
Theorem 4.9 Let $3 \leq k \leq n$. Then $\kappa\left(H_{n} ; P_{k}\right)=\kappa^{s}\left(H_{n} ; P_{k}\right)=\left\lceil\frac{2 n}{k+1}\right\rceil$ if $k$ is odd; $\kappa\left(H_{n} ; P_{k}\right)=$ $\kappa^{s}\left(H_{n} ; P_{k}\right)=\left\lceil\frac{2 n}{k}\right\rceil$ if $k$ is even.

## 5 Conclusions

In this paper, we consider the $T$-structure connectivity and $T$-substructure connectivity of the twisted hypercube $H_{n}$ for $T \in\left\{K_{1, r}, P_{k}\right\}$ and show that

$$
\begin{aligned}
& \kappa\left(H_{n} ; K_{1, r}\right)=\kappa^{s}\left(H_{n} ; K_{1, r}\right)=\left\lceil\frac{n}{2}\right\rceil \text { for } n \geq 4 \text { and } 3 \leq r \leq 4 ; \\
& \kappa\left(H_{n} ; P_{k}\right)=\kappa^{s}\left(H_{n} ; P_{k}\right)= \begin{cases}n, & \text { if } k=1, \\
n-1, & \text { if } k=2 \text { and } \kappa(n-1)=1, \\
n, & \text { if } k=2 \text { and } \kappa(n-1) \geq 2, \\
\left\lceil\frac{2 n}{k+1}\right\rceil, & \text { if } 3 \leq k \leq n \text { and } k \text { is odd }, \\
\left\lceil\frac{2 n\rceil}{k}\right\rceil, & \text { if } 4 \leq k \leq n \text { and } k \text { is even. }\end{cases}
\end{aligned}
$$

However, determining the $K_{1, r}$-structure connectivity and $K_{1, r}$-substructure connectivity of $H_{n}$ with $r \geq 5$ remain open. To explore $\kappa\left(H_{n} ; C_{k}\right)$ and $\kappa^{s}\left(H_{n} ; C_{k}\right)$, the approach used in this paper is invalid as $H_{n}$ is a nonbipartite graph. But one may explore the structure connectivity and substructure connectivity of other interconnection networks by the approach used in this paper.
